

Figure 4. Causal patching across 5 (source, target, layer) cells. Targeted PATCH (coloured) vs. norm-matched RANDOM_NORM (grey, hatched), per reference axis. A cell is causally arity-respecting only when targeted ΔKL clearly exceeds RANDOM_NORM on the same axis. For Cell 2 (AMBIG) the per-word Δ_{specific} 95% CI is overlaid (black caps); both axes' CIs straddle zero, so the mean-ratio WEAK PASS does not firm up under the per-word bootstrap. (extra) = reviewer-round-1 follow-up cell.
